```
The present sequence represents the complete genome of Chlamydia Pneumoniae, and encodes proteins AAR34584-Y35879. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent office media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see
                                                                                                                                                                                                         Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis;

Senome sequence of Chlamydia trachomatis

Claim 1; Page 373-656; 1755pp; English

The present sequence represents the complete genome of Chlamydia trachomatis. Open reading frames (ORFs) of the genome encode

ġ polypeptides AAY36754-Y37949. The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and tihozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendeminc trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perhepatitis, bartholinitis; pneumopathy in breast feeding infants; and veneral lamphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases. The present sequence represents the complete genome of Chlamydia pneumoniae, and encodes proteins AAY34884-Y35879. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, encoded by the open reading frames of the C. pneumoniae genome (see AAX34584-Y3579) can be used in immunospenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

Sequence 1230025 BP; 367213 Å; 249833 C; 249013 G; 363589 T; 377 other;

trachomatis. Open reading frames (ORFs) of the genome encode polypeptides AAX36754-Y37949. The polypeptides can be used as vaccines against chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.

                                                                                                                                          This clone is from an A. gambiae BAC library (ND-TAM) provided by F.H. Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of bar from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M Universty BAC Center University, College Station, Texas 77843-2123, USA using a HindIII

Another Vector: play217; Genomic DNA from Rhodobacter Sphaeroides was prepared and partially digested with Sau3A1. Size selected (20kb) fragments were subcloned into the BglII site of the cosmid vector play2917 (Allen, L. N. and R. S. Hanson. 1985. Journal of Bacteriology. 161:955-962. The library was then ordered around chromosome II of Rhodobacter sphaeroides (Choudhary et al., 1994. Journal of Bacteriology, 176:764-7702). The cosmids were then digested with a variety of restriction enzymes (BamHI, EcoRI, BgIII, PStI, EcoRV, NotI and

Gene discovery through genomic sequencing of Brucella abortus
Infect. Immun. 69 (2), 865-868 (2001)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Email: Siv.Andersson@ebc.uu.se
Sequences were basecalled with phred and vector was masked with
crossmatch (see http://genome.washington.edu). Sequences were then
trimmed from both ends to remove low quality bases and masked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Brucella melitensis biovar Abortus.
Brucella melitensis biovar Abortus
Bacteria; Proteobacteria; alpha subdivision; Rhizobiaceae group;
Brucellaceae; Brucella.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /clone="UD1690"

/note="Vector: pBelcBAC11; Site_1: HindIII; Site_2:
HindIII: Rice is one of two most popular grains in the
World. Half of the World population especially those
inhabiting highly populated areas of the humid tropics
and subtropics, rely on rice as their primary source of
carbohydrate. Monocotyledonous rice is a diploid plant
(2n=24) with a haploid genome equivalent of 431 Mbp
(Arumuganathan and Earle, 1991). The relatively small
genome of rice, three times larger than that of
Arabidopsis, makes it suitable for genomic studies. In
order to facilitate positional cloning, physical mapping
and genome sequencing of rice, we have constructed a BAC
library from Orycas activa, Nipponbare variety. The
cof 128:5 Kb providing 10:9 happioid genome equivalents. The
deep coverage allows the isolation a particular sequence
with a probability of 99:9%. Two high density filters,
each containing 18,432 clones (doubly spotted), represent
the Whole library for colony screening."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            seq_name: gb_gss:B07745
```

genome sequencing Genome Campus, Hinxton,

```
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Barrell, Oxford University Press, 1999).
Email: nelsayed@tigr.org
Details of T. brucei sequencing at the Sanger Centre are available
at http://www.sanger.ac.uk/Projects/T_brucei/.

                                                                                                                                                                                                    COMMENT
DNSSEI) and restriction fragments subcloned into the respective multiple cloning site sites of pBluescript SK (-). Note BBILL fragments were subcloned into the pBluescript BamHI site. DNSSEI fragments were subcloned into the ECORV site. All subclones were transformed into the sequences where possible were assembled using the GCG program GELASSEMBLE. "

Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from month patched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M Universty BAC Center University, College Station, Texas 77843-2123, USA using a HindIII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  301 uAsnAsnMetLysLeuArgGluAlaLeuAlaSerAlaLeuAspLysGluA 318

Constructed at the Institute for Genomic DNA isolated from a cloned population of
Rockville, WD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TRED927/4 GUTat 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
